

License Rights Directly in Your Workflow

License Rights Where You Need Them

The RightFind™ API makes it easy for your end users to check license rights in their systems of choice. With a single click in their third-party applications, end users can view their rights to share, store and re-use published content under your organization's Multinational Copyright License.

Interoperable API Specifications

The RightFind API communicates using the HTTP protocol and implements a RESTful workflow. It supports both JSON and XML formats.

What is an API?

An API (Application Programming Interface) allows applications to communicate with each other. Your preferred applications can communicate with RightsDirect's back-end data systems to discover which usage rights are covered by your Multinational Copyright License.

Key Benefits

Flexible — The RightFind API offers the flexibility to integrate rights from your Multinational Copyright License directly into any application, allowing the RightsDirect rights database to be accessed via that application's interface.

Efficient — End users can check rights in the search interface they are already using without interrupting their workflow.

Compliant — Users can easily determine how to share a document with colleagues, thus minimizing risk of copyright infringement.

About RightsDirect

RightsDirect, a Copyright Clearance Center subsidiary, provides content and licensing solutions that make copyright compliance easy, allowing companies to re-use and share the most relevant digital content across borders.
